LEDS AIRPORTS

BIM

Building Information Modeling (BIM) or Construction Information Modeling promotes more assertive timelines, estimation and risk analysis, integration of all processes into buildings, and better facility management. In addition, it offers the opportunity to try previous solutions. In this way, projects can be better understood and revised at any time during the project.

Leds advises BIM to plan public or private contracting, analysis and elaboration of BEPs, inspection and elaboration of basic projects, pre-BEP analysis, preliminary design, 3D registration (as built) of laser decks and complementary systems, monitoring of laser floor conditions with issuance of an award.

Other: Checking of projects and analysis of parameters for asset management (Facility Management).

BENEFITS THAT BIM PROMOTES TO YOUR PROJECT:

- ➔ Compliance with the dates stipulated in the work schedule;
- ➔ Opportunity to test solutions in advance;
- ➔ The project can be understood, revised and viewed more easily, which helps ensure more accuracy and evaluate alternatives to optimize resources and processes;
- ➔ More efficient communication among project participants and fluency in building information sharing.
